- Motivation
- Research gap & Aim of the paper
- Theoretical background
- Methodology
- Data
- Results & Discussion
- Further research & Limitations

- Use this slide to explain why the topic matters in practice or theory.
- Start with one strong message in bold, then add a short explanation.

Example: mention a policy issue, market trend, research problem, or project motivation.

- Add one or two supporting points only.
- Keep the first content slide light and easy to follow.

- Use this slide to explain what is missing in the literature or in existing practice.
- End the slide with a clear research question, project goal, or hypothesis.
- Tables work well here for comparisons or summary statistics.

Table: Summary statistics of XX

Country	Mean X	Min X	Max X
AT	0.29	0.28	0.30
BE	0.27	0.25	0.29
BG	0.23	0.20	0.28

- Summarize the key theory, framework, or model used in your work.
- If needed, include one equation only and explain each variable verbally.

$$Y = \beta_0 + \beta_1 X + \epsilon \quad (1)$$

- Describe your method, model, experiment, case study design, or implementation process.
- Keep it structured: data source, variables, procedure, and evaluation approach.
- If the method is complex, split it across two slides rather than overcrowding one.

- Use this slide for datasets, sample construction, variables, or materials.
- Mention the time range, source, sample size, and any preprocessing.
- A compact table or flowchart can work well here.

- Present only the most important result on each slide.
- Figures are often easier to read than dense tables during a presentation.
- Use the discussion point to explain why the result matters.

Figure: Example figure placeholder

- Briefly acknowledge the main limitation of the current work.
- Suggest what could be improved with more time, more data, or a different method.
- End on a constructive note rather than a purely negative one.

Thank you for your attention
